# LASTING PROTECTION FOR ANY APPLICATION

Installing a new polyethylene liner in your dump or utility box will not only repair and protect your equipment but also help avoid hazardous high stage dumping. Designed for any size and application, OPS will custom fit a liner specifically for your equipment to handle everything from the stickiest materials to hot asphalt up to 350° F.

## H.M.W. Polyethylene

- H.M.W. (High Molecular Weight) is the most common liner material used and is suitable for most common materials and will not fracture in cold temperatures
- Available in black or white material, white offers less expansion for applications where minimal heaving of the liner is critical
- Continuous length, seamless liners are available in 3/16", 1/4", 3/8" and 1/2"
- The most economical of all standard liner options

## U.H.M.W. Polyethylene

- In addition to the benefits of a standard liner, U.H.M.W. (Ultra High Molecular Weight) include self lubricating characteristics which provide superior performance when handling sticky materials
- High temperature options are also available for asphalt and other hot materials up to 350° F

Complete installation is also available by Osseo Plastics to ensure your liner is properly installed and will last. Continuous, single piece liners coupled with steel or aluminum hold-down plates ensure materials will not work beneath the liner creating premature wear. Liner may also be added at the front and doghouse for additional protection.
